The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          571 ытытытытытытытыты мүчүн байрын байрын бай

                                                                                                                                                                                                                                                                                                                          The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (FTM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           721 ttcggatcaagctcattttcaccagacggaaggtatcttgctttgcttggaaatgaaag 780

Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on Nucleic acids containing electron-transfer single surface

Example 6; Page 127; 159pp; English.

HHHX NXUUUUUX N

The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.

Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on
                                                                                                                                                                                                                                                                                                                   The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

                          Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping, monitoring gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cgcatgatgtttacataatgtcactggagtctggagatcttaagcaggttacacctcatc 712

/rote="Vector: pHOS1; Site_1: Bst 1; Constructed at The Institute for Genomic Research (TIGR), Rockville, MD.
Genomic DNA isolated from broth cultures of E. histolytica using a method described by Clark and Diamond, L.S. (1993) Entamoeba histolytica: C.G., and Diamond, L.S. (1993) Entamoeba histolytica: a method for isolate identification. Exp. Parasitol.
/7:450.). The DNA was mechanically sheared to give a tight size distribution (-2 kb). The v + i method used for the library construction is described in detail in Smith, H.O. and Venter, J.C. (Making small insert libraries for whole genome shotgun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barell, Oxford University Press, 1999)."

Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP).

The BDGP is constructing a physical map of the Drosophila Genome Project (BDGP).

The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain v2; cn bw sp, the same strain used for the BDGP's pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BAGs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RECI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; on bw sp, the same strain used for the BDGP's Pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be location/Qualifiers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  potato.

method for isolate identification. Exp. Parasitol. 77:450.). The DNA was mechanically sheared to give a tight size distribution (-2 kb). The v + i method used for tight size distribution (-2 kb). The v + i method used for the library construction is described in detail in Smith, H.O. and Venter, J.C. (Making small insert libraries for whole genome shotgun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barell, Oxford University Press, 1999)."

When I wave genoscope.cns.fr.

Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP).

The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the Isogenic strain v2; on bw sp, the same strain used for the BDGP's pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://Dacpac.med.buffalo.edu/drosophila_bac.htm.
C.G., and Diamond, L.S. (1993) Entamoeba histolytica: a method for isolate identification. Exp. Parasitol. 77:450.). The DNA was mechanically sheared to give a tight size distribution (-2 kb). The v + i method used for the library construction is described in detail in Smith, H.O. and Venter, J.C. (Making small insert libraries for whole genome shotgun sequencing projects. In Genome Sequencing: A Practical Approach, eds. M. Vaudin and B. Barell, Oxford University Press, 1999)."

Serine protease SP1; YUXL; detergent.

This invention describes novel Gram positive bacterial hydrolases, namely YUXL, YTMA, YIPV, TQKD, YCLE, YTAP, YDEN, YBEK, YFHM, YDJP, YVFQ, YVAM, YQJL, SRFAD, YCGS, YTPA, YBAC, YUII, YODD, YJCH and YODH. The encoding nucleic acid and its fragments, are useful as probes to detect fram-positive hydrolases. The gram-positive microorganisms are used to produce recombinant hydrolases which are useful in cleaning (e.g. detergent) or textile treatment compositions, and in animal feeds. Other uses include peptide hydrolysis, waste treatment and cleavage of fusion proteins.

Bacillus subtilis serine protease SP1 (YUXL).

(first entry)

21-MAY-1999

```
This polypeptide comprises serine protease SP1 (YUXL) of Bacillus SUbtilis.

Subtilis. Novel serine proteases SP1, SP2, SP3, SP4 and SP5 (see Subtilis. Novel serine protease SP1, SP2, SP3, SP4 and SP5 (see AAW97789-93) were identified via a FASTA search of Bacillus subtilis genomic nucleic acid sequences. SP1 was identified by its spencine brotease dap2 of yeast.

SP2, SP3, SP4 and SP5 were identified by their structural and overall amino acid homology to SP1. Host relia in which the correllance of homology to SP1. Host cells in which the contrainty occurring gene encoding one or more of SP1, SP2, SP3, SP4 or SP5 (see AAX07301-04) is mutated such that the proteolytic of heterologous proteins, e.g. a hormone, enzyme, growth factor, of heterologous proteins, e.g. a hormone, enzyme, growth factor, cytokine, protease, carbohydrase, lipase, racemase, epimerase, cytokine, sp. SP3, SP4 and SP5 can also be produced on a large scale of a microbial host expression system for use in cleaning compositions and contact lens cleaning solutions, or for peptide compositions and contact lens cleaning solutions, as animal feed fusion-cleavage enzymes in protein production, and as animal feed
                                                                                                                                                                                                                                                                                                                                                               Use of serine protease genes from Gram-positive microorganisms - for modification of host cells for the production of heterologous proteins or for producing proteins for use in cleaning compositions
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Disclosure; Fig 1A-C; 37pp; English.

hydrolase. The enzyme has the following properties: (a) it hydrolyses an acylepetide; (b) an optimum temperature of 90-95 degrees Centigrade; (c) an optimum pH of 5.0-6.0; (d) no loss of activity when heated to 95 degrees Centigrade for 3 hours at pH 7.5; and (e) a molecular weight of 60 kDa. The enzyme is claimed useful for hydrolysing the amino end of an acylated protein and a peptide at high temperatures.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      27;
                                                                                                                                                                                                                             This protein comprises a novel thermostable amidase of the archaebacterium Thermococcus GU5L5. Its amino acid sequence was deduced from an isolated nucleic acid (see AAV12887). Recombinant amidase can be produced in transformed host cells, especially prokaryotic cells. The amidase is used to remove Arg, Phe or Met from the N-terminus of synthetic peptides or peptidomimetics of claimed). Removal of the N-terminal residue can be done even in the presence of a more reactive ester bond (very difficult to achieve non-enzymatically). The amidase is selective for L-amino acids and can therefore be used to produce optically active compounds. The protein tolerates temperatures up to at least 70 degc and high concentrations of organic solvent (e.g. over 40% degc and high so can cleave bonds that are normally

The present sequence represents a H3 homologue of a prolyl tripeptidase (designated DPP) from Porphyromonas gingivalis. The prolyl tripeptidyl-peptidase has an amidolythic activity, and cleaves a peptide bond in a target polyle having at least 4 amino acids. This bond is between a proline and an amino acid attached to the alpha-carboxyl group end of the proline. The polypeptide is useful for identifying inhibitors. These inhibitors are then useful for reducing the growth of bacterium or for protecting an animal from a periodontal disease such as gingivitis and periodontitis caused by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        prolyl tripeptidyl-peptidase, active analog, fragment or variant useful for identifying its inhibitor which is useful for protecting an animal from a periodontal disease such as gingivitis and periodontitis

                                                                                                       The present sequence represents a H2 homologue of a prolyl tripeptidyl-peptidase (designated DPP) from Porphyromonas gingivalis. The prolyl tripeptidyl-peptidase has an amidolytic activity, and cleaves a peptide bond in a target pollypeptide having at least 4 amino acids. This bond is between a proline and an amino acid attached to the alpha-carboxyl group and of the proline. The polypeptide is useful for identifying inhibitors. These inhibitors are then useful for periodontal disease such as gingivitis and periodontitis caused by
for identifying its inhibitor which is useful for protecting an animal from a periodontal disease such as gingivitis and periodontitis \dot{}

Recombinant acyl-peptide hydrolase -used to catalyse hydrolysis of N-acyl peptide(s) or reaction of N-acetyl amino acid donor and acceptor protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence contains the claimed sequence of acyl-peptide hydrolase (APH) (claim 1, page 11). APH can be used to catalyse the hydrolysis of the N-terminal acyl amino acid of an acylated polypeptide, or the reaction between a derivatised N alpha-acetyl amino acid donor and acceptor with a free alpha-NH2. It can also be used to make refractory proteins susceptible to Edman sequencing or th reduce degradation of proteins to
                                                                                                                                                                                                                                                                                                                                                                       /note="potential site of glycosylation"
                                                                                                                                                                                                                                                                                                                                                                                              /note="potential site of glycosylation"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A human liver cell cDNA library was screened with a cDNA fragment of porcine acyl amino acid acid isolating enzyme-like polypeptide as probe. A positive clone was analysed and sequenced.
